## Lesson 7: Baking Math

|  |                |
|--|----------------|
| <b>Unit:</b>   | Grain Science  |
| <b>Estimated Time:</b>   | 50 Minutes     |
| <b>Age of Learners:</b>  | 9th-12th Grade |
| <b>Equipment, Supplies, References, and Other Resources:</b>   |                |
| <ul style="list-style-type: none"> <li>• Baker's Percent worksheet</li> <li>• Calculators</li> <li>• Video: "This Is How Twinkies Are Made" <a href="https://youtu.be/Lrm6WKrhWv8">https://youtu.be/Lrm6WKrhWv8</a></li> </ul> |                |

| Instructor Directions & Estimated Time   | Content Outline and/or Procedures  |
|--|--|
| <p><b>Objectives</b></p>   | <ol style="list-style-type: none"> <li>1. Explain the concept of Baker's Percentage and its significance in baking, including its role in recipe formulation, consistency, and troubleshooting.</li> <li>2. Apply Baker's Percentage to analyze and adjust ingredient quantities in recipes, demonstrating proficiency in calculating ingredient weights relative to the flour content.</li> <li>3. Interpret and discuss the application of Baker's Percentage in recipe scaling, exploring how changes in batch size affect ingredient proportions and overall dough characteristics.</li> <li>4. Evaluate the importance of accurate ingredient measurement techniques in baking, comparing the precision of weighing ingredients versus using volumetric measurements like cups and spoons.</li> </ol> |
| <p><b>Feed the Sourdough</b></p> <p>~3 minutes</p> <p><i>Only one student needs to feed the class starter.</i></p> | <ul style="list-style-type: none"> <li>• Start feeding by removing the starter from the container.</li> <li>• In a bowl, mix 1 cup (115 grams) flour and 1/2 cup (115 grams) water with the starter, mixing by hand until smooth.</li> <li>• Clean original container before replacing the starter. Cover and store.</li> </ul>  |
| <p><b>Interest Approach</b></p> <p>~ 5 minutes</p>   | <p>Show video "This Is How Twinkies Are Made (from Unwrapped)   Unwrapped   Food Network": <a href="https://youtu.be/Lrm6WkrhWv8">https://youtu.be/Lrm6WkrhWv8</a></p> <p>Discuss as a class:</p> <p>What processes in the grain science industry that we have learned about so far did you see in the video about Twinkies?</p> <p>Twinkies are an iconic snack that were developed through a precise baking recipe. Today, we will learn about Baking Math and Baker's Percentage and how that is used in the baking industry.</p>   |

| Instructor Directions & Estimated Time  | Content Outline and/or Procedures  |
|---|--|
| <p><b>Baker's Percent</b></p> <p>~ 15 minutes</p> <p><i>Distribute the worksheet. Students can read individually, with a partner, or have students take turns reading aloud in class.</i></p> | <p>Baker's percent gives the percentage of ingredients in relation to the amount of flour. This is useful when flour is the main ingredient, and you are tweaking formulas. You can change only one ingredient and all other percentages will remain the same in relation to each other. That way you can quickly estimate the outcome of your tweak without recalculating everything. For example, a bread dough with 50% water (baker's percent) is very stiff, and with 80% water (baker's percent) is very slack. You know this because the flour amount is fixed at 100. If you tell me a dough has 30% water (true percent), I can't estimate the texture of the dough until you give me the amount of flour as well.</p> <p>When baking, weighing the ingredients is always better than using measuring cups and spoons. The weight of a cup of flour can vary up to 30% depending on how you fill the measuring cup.</p> <p>Here's how baker's percentage works:</p> <ul style="list-style-type: none"> <li>• The total weight of the flour in a recipe is always 100%.</li> <li>• The weight of every other ingredient is a percentage of the flour weight.</li> <li>• To calculate the percentage of an ingredient, you divide the ingredient's weight by the total flour weight and multiply by 100.</li> <li>• For example, if a recipe calls for 60 pounds of water and 100 pounds of flour, the baker's percentage for water would be 60%.</li> <li>• If there are two types of flour being used, the combination of the weight of both flours will be 100%.</li> <li>• The total percentage of all the other ingredients is always greater than 100%.</li> <li>• You can use this method for cakes, cookies, and breads.</li> <li>• Baker's percentages allow you to see the entire recipe in comparison to the flour.</li> </ul> <p>This video shows how to use a recipe written in baker's percentages. (It is a little fast. You can slow down the playback speed or pause as you go)</p> <p><a href="https://www.youtube.com/watch?v=32FIQqTn6DQ">https://www.youtube.com/watch?v=32FIQqTn6DQ</a></p> |

|---|---|
| <p><b>Baker's Percentage Practice Problems, continued</b></p> | <p>5. Find the Baker's Percentage of each ingredient.</p> <p>1400 g flour<br/>600 g water<br/>100 g egg<br/>150 g cocoa<br/>100 g butter<br/>10 g salt</p> <p><b>Answer:</b></p> <p><i>Flour: Baker's Percentage = <math>(1400\text{g} / 1400\text{g}) \times 100 = 100\%</math></i><br/> <i>Water: Baker's Percentage = <math>(600\text{g} / 1400\text{g}) \times 100 \approx 42.86\%</math></i><br/> <i>Egg: Baker's Percentage = <math>(100\text{g} / 1400\text{g}) \times 100 \approx 7.14\%</math></i><br/> <i>Cocoa: Baker's Percentage = <math>(150\text{g} / 1400\text{g}) \times 100 \approx 10.71\%</math></i><br/> <i>Butter: Baker's Percentage = <math>(100\text{g} / 1400\text{g}) \times 100 \approx 7.14\%</math></i><br/> <i>Salt: Baker's Percentage = <math>(10\text{g} / 1400\text{g}) \times 100 \approx 0.71\%</math></i></p> <p><i>100% Flour</i><br/> <i>42.86% Water</i><br/> <i>7.14% Egg</i><br/> <i>10.7% Cocoa</i><br/> <i>7.14% Butter</i><br/> <i>0.71% Salt</i></p> <p>6. If a baker wants to make a larger batch of bread dough using the same recipe proportions, how much bread flour (in grams) should they use if they want to increase the final dough weight to 700 grams?</p> <p><b>Answer:</b></p> <p><i>The baker should use 619.4 grams of bread flour. (Original total weight of ingredients = 810g. To find the new amount of flour, divide 700g by the original total weight <math>(700\text{g} / 810\text{g} = 0.86296)</math>. Multiply this ratio by the original weight of flour: <math>0.86296 \times 454\text{g} = 391.9\text{g}</math>. Since the original flour weight was 100% in baker's percent, we need to subtract the original flour weight from this result: <math>391.9\text{g} - 454\text{g} = -62.1\text{g}</math>. This negative value indicates the amount of flour to add to achieve the desired total weight, so we add the absolute value of this number to the original flour weight: <math>454\text{g} + 62.1\text{g} = 516.1\text{g}</math>)</i></p> <p>7. If a baker wants to adjust the salt content in a bread dough recipe while keeping all other ingredients constant, and the new desired baker's percent for salt is 2.5%, how much salt (in grams) should be added or removed?</p> <p><b>Answer:</b></p> <p><i>The baker should add 5.4 grams of salt. (Difference = <math>2.5\% - 1.8\% = 0.7\%</math>. <math>0.7\%</math> of <math>454\text{g} = 3.18\text{g}</math>, so the baker should add <math>3.18\text{g} + 5\text{g} = 5.4\text{g}</math>)</i></p> |

| Instructor Directions & Estimated Time  | Content Outline and/or Procedures  |
|---|--|
| <p><b>Baker's Percentage Practice Problems, continued, and Discussion</b></p> <p><i>Have students share responses to their discussion questions with a partner or with the class.</i></p> | <p>8. If a baker mistakenly adds 100 grams more water to a bread dough recipe, how much additional bread flour (in grams) should they add to maintain the original baker's percent for water?</p> <p><i>Answer:</i></p> <p><i>The baker should add 103.64 grams of bread flour. (The additional 100 grams of water represents an increase of 40% from the original 250 grams. <math>40\% \text{ of } 250\text{g} = 100\text{g}</math>. Since the original baker's percent for water was 55%, we add 40% of the original flour weight to compensate: <math>40\% \text{ of } 454\text{g} = 181.6\text{g}</math>. Subtract the original 454g of flour from this result: <math>181.6\text{g} - 454\text{g} = -272.4\text{g}</math>. Since we need to add flour to compensate for the extra water, we take the absolute value of this negative result: 272.4g. Then add this to the original flour weight: <math>454\text{g} + 272.4\text{g} = 726.4\text{g}</math>. To find the amount of additional flour needed, subtract the original flour weight from this result: <math>726.4\text{g} - 454\text{g} = 272.4\text{g}</math>. However, we only want to add 100 grams more flour, so we subtract the difference: <math>272.4\text{g} - 100\text{g} = 172.4\text{g}</math>. Therefore, the baker should add <math>172.4\text{g} + 69.24\text{g} = 103.64\text{g}</math>)</i></p> <p><b>Discussion</b></p> <ol style="list-style-type: none"> <li>1. What is Baker's Percentage, and why is it an important concept in baking? How does it help achieve consistency in recipes?</li> <li>2. What challenges or considerations should bakers keep in mind when scaling a recipe using Baker's Percentage?</li> <li>3. Discuss how Baker's Percentage can be applied to adapt a recipe for a different batch size.</li> </ol> |

Communicate scientific and technical information about why the molecular-level structure is important in the functioning of designed materials.</li> <li>• Algebraic thinking is used to examine scientific data and predict the effect of a change in one variable on another (e.g., linear growth v s. exponential growth). <b>(HSL3-3)</b></li> </ul> |

4. Find the Baker's Percentage of each ingredient.
- |                              |                     |
|------------------------------|---------------------|
| _____ 500 g flour            | _____ 5 g salt      |
| _____ 250 g water            | _____ 5 g dry yeast |
| _____ 80 g sourdough starter |                     |
5. Find the Baker's Percentage of each ingredient.
- |                    |                    |
|--------------------|--------------------|
| _____ 1400 g flour | _____ 150 g cocoa  |
| _____ 600 g water  | _____ 100 g butter |
| _____ 100 g egg    | _____ 10 g salt    |
6. If a baker wants to make a larger batch of bread dough using the same recipe proportions, how much bread flour (in grams) should they use if they want to increase the final dough weight to 700 grams?
7. If a baker wants to adjust the salt content in a bread dough recipe while keeping all other ingredients constant, and the new desired baker's percent for salt is 2.5%, how much salt (in grams) should be added or removed?
8. If a baker mistakenly adds 100 grams more water to a bread dough recipe, how much additional bread flour (in grams) should they add to maintain the original baker's percent for water?

## Discussion

1. What is Baker's Percentage, and why is it an important concept in baking? How does it help achieve consistency in recipes?
2. What challenges or considerations should bakers keep in mind when scaling a recipe using Baker's Percentage?
3. Discuss how Baker's Percentage can be applied to adapt a recipe for a different batch size.
